

KEY

Simple Ionic Compounds Naming

- Simple ionic compounds are composed of a metal and a non-metal.
- Ionic bonds involve the transfer of electrons from one atom to another, creating ions.

RULES:

1. Metallic element is always named first.
2. Non-metallic element named second (lower case), and its ending is changed to "ide".

Example:

CaF_2 Calcium fluoride
 Na_2O sodium oxide

Practice:

Name the compound formed by:

1. Na and Cl sodium chloride
2. K and I potassium iodide
3. Ca and C calcium carbide
4. N and Mg magnesium nitride
5. O and Ba barium oxide
6. Al and I aluminum iodide
7. S and Ba barium sulphide
8. Al and P aluminum phosphide
9. Br and Ba barium bromide
10. K and O potassium oxide

Name the following compounds:

1. NaF sodium fluoride
2. K_2O potassium oxide
3. Ca_3N_2 calcium nitride
4. BaCl_2 barium chloride
5. Na_2S sodium sulphide
6. Ca_3P_2 calcium phosphide
7. K_3P potassium phosphide
8. BaI_2 barium iodide
9. Al_2O_3 aluminum oxide
10. Na_4C sodium carbide
11. AlP aluminum phosphide
12. NaI sodium iodide
13. KBr potassium bromide
14. AlF_3 aluminum fluoride
15. BaO barium oxide
16. K_3N potassium nitride

Simple Ionic Compounds Writing Formulae

- Writing formulae for simple ionic compounds requires that you know the combining capacity of the elements involved.

RULES:

1. Write the symbol and the combining capacity for the metallic element first.
2. Write the symbol and the combining capacity for the non-metallic element second.
3. Criss-cross the combining capacities and reduce to the lowest common multiple.

Example:

Name	Criss-cross	Formula	Simplify
Calcium nitride	$\text{Ca}^{+2} \quad \text{N}^{-3}$	Ca_3N_2	
Magnesium oxide	$\text{Mg}^{+2} \quad \text{O}^{-2}$	Mg_2O_2	MgO

Practice:

Give the formula for the following:

- | | | | |
|--|------------------------------------|------------------------|------------------------------------|
| 1. Sodium iodide | <u>NaI</u> | 9. Rubidium telluride | <u>Rb₂Te</u> |
| 2. Potassium oxide | <u>K₂O</u> | 10. Radium phosphide | <u>Ra₃P₂</u> |
| 3. Barium nitride | <u>Ba₃N₂</u> | 11. Calcium chloride | <u>CaCl₂</u> |
| 4. Francium sulphide | <u>Fr₂S</u> | 12. Magnesium sulphide | <u>MgS</u> |
| 5. Cesium phosphide | <u>Cs₃P</u> | 13. Potassium bromide | <u>KBr</u> |
| 6. Lithium fluoride | <u>LiF</u> | 14. Aluminum oxide | <u>Al₂O₃</u> |
| 7. Beryllium ^{sulphide} carbide | <u>Be₃S</u> | 15. Zinc chloride | <u>ZnCl₂</u> |
| 8. Strontium selenide | <u>SrSe</u> | 16. Potassium nitride | <u>K₃N</u> |

Multi-valent Metals / Transition Metals Naming

- Many transition metals, found in the centre block of the periodic table, have more than one possible combining capacity.
- They are therefore called multi-valent.

RULES:

1. Metallic element is always named first, followed by the combining capacity being used in Roman Numerals.
2. Non-metallic element named second (lower case), and its ending is changed to "ide".

Example:

Hint: "Un-criss-crossing" the combining capacities may help!

Practice:

Name the following compounds:

- | | | | |
|----------------------------|-------------------------------|------------------------------|------------------------------|
| 1. CuO | <u>Copper II oxide</u> | 9. AuCl_3 | <u>gold III chloride</u> |
| 2. CrCl_3 | <u>chromium III chloride</u> | 10. CrBr_3 | <u>chromium III bromide</u> |
| 3. MoS | <u>molybdenum II sulphide</u> | 11. TiN | <u>titanium III nitride</u> |
| 4. Tc_2O_7 | <u>technetium oxide</u> | 12. SnF_4 | <u>tin (IV) fluoride</u> |
| 5. CoCl_2 | <u>cobalt II chloride</u> | 13. Pb_3N_4 | <u>lead IV nitride</u> |
| 6. PtS_2 | <u>platinum II sulphide</u> | 14. Cu_2S | <u>copper I sulphide</u> |
| 7. Tl_2O_3 | <u>thallium III oxide</u> | 15. Pd_3As_2 | <u>palladium II arsenide</u> |
| 8. CuCl_2 | <u>copper II chloride</u> | 16. IrO_2 | <u>iridium IV oxide</u> |

Multi-valent Metals / Transition Metals Writing Formulae

- The only difference between these compounds and other ionic compounds is that the combining capacity of the metal is given to you in Roman Numerals following the name of the metal.

RULES:

- Write the symbol and the combining capacity for the metallic element first.
- Write the symbol and the combining capacity for the non-metallic element second.
- Criss-cross the combining capacities and reduce to the lowest common multiple.

Example:

Name	Criss-cross	Formula	Simplify
Gold (III) oxide	$Au^{+3} \quad O^{-2}$	Au_2O_3	
Chromium (II) sulphide	$Cr^{+2} \quad S^{-2}$	Cr_2S_2	CrS

Practice:

Give the formula for the following:

- Manganese (IV) oxide MnO₂
- Cobalt (III) ^{nitride} boride Co₃N
- Palladium (IV) bromide PdBr₄
- Osmium (III) selenide Os₂Se₃
- ^{Plutonium} Tungsten (VI) sulphide PuS₃
- Rhenium (VII) arsenide Re₃As₇
- Mercury (II) oxide HgO
- Polonium (IV) astatide PoAt₄
- Thallium (III) phosphide Tl₃P
- Antimony (V) telluride Sb₂Te₅
- Lead (IV) oxide PbO₂
- Cobalt (II) chloride CoCl₂
- Nickel (III) sulphide Ni₂S₃
- Niobium (V) phosphide Nb₃P₅

Polyatomic Ions Naming

- Polyatomic ions are groups of tightly bound atoms with an overall ionic charge that behave as if they were a single metallic or non-metallic ion during chemical changes.

TABLE 2.3 Some Common Polyatomic Ions			
Formula	Name	Formula	Name
<i>Cation</i>		<i>Singly charged anions (continued)</i>	
NH ₄ ⁺	Ammonium	NO ₂ ⁻	Nitrite
<i>Singly charged anions</i>		NO ₃ ⁻	Nitrate
CH ₃ CO ₂ ⁻	Acetate	<i>Doubly charged anions</i>	
CN ⁻	Cyanide	CO ₃ ²⁻	Carbonate
ClO ⁻	Hypochlorite	CrO ₄ ²⁻	Chromate
ClO ₂ ⁻	Chlorite	Cr ₂ O ₇ ²⁻	Dichromate
ClO ₃ ⁻	Chlorate	O ₂ ²⁻	Peroxide
ClO ₄ ⁻	Perchlorate	HPO ₄ ²⁻	Hydrogen phosphate
H ₂ PO ₄ ⁻	Dihydrogen phosphate	SO ₃ ²⁻	Sulfite
HCO ₃ ⁻	Hydrogen carbonate (or bicarbonate)	SO ₄ ²⁻	Sulfate
HSO ₄ ⁻	Hydrogen sulfate (or bisulfate)	S ₂ O ₃ ²⁻	Thiosulfate
OH ⁻	Hydroxide	<i>Triply charged anion</i>	
MnO ₄ ⁻	Permanganate	PO ₄ ³⁻	Phosphate

RULES:

1. Follow regular naming rules except that the name of the polyatomic ion is never changed.

Example:

Mg(NO ₃) ₂	Magnesium nitrate
NH ₄ Cl	Ammonium chloride
Pb(NO ₃) ₂	Lead (II) nitrate

Practice:

Name the following compounds:

- | | | | |
|--|-----------------------------|---------------------------------------|----------------------------|
| 1. NaOH | <u>Sodium hydroxide</u> | 9. NaHSO ₄ | <u>Sodium bisulphate</u> |
| 2. CaCO ₃ | <u>calcium carbonate</u> | 10. NH ₄ Br | <u>ammonium bromide</u> |
| 3. KClO ₃ | <u>potassium chlorate</u> | 11. Na ₂ SO ₄ | <u>sodium sulphate</u> |
| 4. NaHCO ₃ | <u>sodium bicarbonate</u> | 12. Ba(OH) ₂ | <u>barium hydroxide</u> |
| 5. AlPO ₄ | <u>aluminum phosphate</u> | 13. Fe(NO ₂) ₃ | <u>iron(II) nitrite</u> |
| 6. AuClO ₃ | <u>gold (I) chlorate</u> | 14. (NH ₄) ₂ O | <u>ammonium oxide</u> |
| 7. NiPO ₄ | <u>Nickel(II) phosphate</u> | 15. MgSO ₄ | <u>magnesium sulphate</u> |
| 8. K ₂ Cr ₂ O ₇ | <u>potassium dichromate</u> | 16. CuSO ₄ | <u>Copper(II) sulphate</u> |

Polyatomic Ions Writing Formulae

- Writing formulae for these compounds is not much different than writing formulae for regular ionic compounds. The rules are basically the same with a few additions.

RULES:

1. Write the symbol and the combining capacity for the metallic element first or the polyatomic ion ammonium if present.
2. Write the symbol and the combining capacity for the negative polyatomic ion second.
3. Criss-cross the combining capacities and reduce to the lowest common multiple.
4. Remember to use brackets if there is more than one group of the polyatomic ion.

Example:

Name	Criss-cross	Formula
Ammonium nitride	$\text{NH}_4^{+1} \quad \text{N}^{-3}$	$(\text{NH}_4)_3\text{N}$
Sodium carbonate	$\text{Na}^{+1} \quad \text{CO}_3^{-2}$	Na_2CO_3

Practice:

Give the formula for the following:

- | | | | |
|------------------------|--|---------------------------|--|
| 1. Cadmium nitrate | <u>$\text{Cd}(\text{NO}_3)_2$</u> | 8. Ammonium dichromate | <u>$(\text{NH}_4)_2\text{Cr}_2\text{O}_7$</u> |
| 2. Strontium phosphate | <u>$\text{Sr}_3(\text{PO}_4)_2$</u> | 9. Lithium carbonate | <u>Li_2CO_3</u> |
| 3. Ammonium sulphide | <u>$(\text{NH}_4)_2\text{S}$</u> | 10. Aluminum bisulphate | <u>$\text{Al}(\text{HSO}_4)_3$</u> |
| 4. Magnesium chlorate | <u>$\text{Mg}(\text{ClO}_3)_2$</u> | 11. Lead (IV) sulphite | <u>$\text{Pb}(\text{SO}_3)_2$</u> |
| 5. Barium sulphate | <u>BaSO_4</u> | 12. Cobalt (III) cyanide | <u>$\text{Co}(\text{CN})_3$</u> |
| 6. Cesium bicarbonate | <u>CsHCO_3</u> | 13. Chromium (VI) acetate | <u>$\text{Cr}(\text{CH}_3\text{COO})_6$</u> |
| 7. Calcium hydroxide | <u>$\text{Ca}(\text{OH})_2$</u> | 14. Ammonium phosphate | <u>$(\text{NH}_4)_3\text{PO}_4$</u> |

Hydrates Naming & Formulae

- hydrates are molecules which include water molecules in their crystal structure
- they are created when a crystal of an ionic compound is grown by evaporation from an aqueous solution
- name the compound as normal then add a prefix to describe how many water molecules are attached with the word "hydrate"

Number	Greek Prefix	Number	Greek Prefix
1	mono	6	hexa
2	di	7	hepta
3	tri	8	octa
4	tetra	9	nona
5	penta	10	deca

ex. $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ = copper (II) sulphate pentahydrate
 $\text{Zn}(\text{CH}_3\text{COO})_2 \cdot 2\text{H}_2\text{O}$ = zinc acetate dihydrate

✦ Name the following hydrated compounds:

- a. $\text{FeBr}_3 \cdot 6\text{H}_2\text{O}$ iron III bromide · hexahydrate
- b. $\text{Li}_2\text{Cr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$ lithium dichromate · dihydrate
- c. $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ aluminum oxide · trihydrate
- d. $\text{CoF}_2 \cdot 4\text{H}_2\text{O}$ cobalt II fluoride · tetrahydrate
- e. $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ sodium carbonate · monohydrate

✦ Write the formula for the following hydrated compounds:

- a. iron (III) phosphate octahydrate $\text{FePO}_4 \cdot 8\text{H}_2\text{O}$
- b. cadmium (II) nitrate tetrahydrate $\text{Cd}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$
- c. copper (II) phosphate trihydrate $\text{Cu}_3(\text{PO}_4)_2 \cdot 3\text{H}_2\text{O}$
- d. chromium (II) oxalate monohydrate $\text{Cr}(\text{C}_2\text{O}_4) \cdot \text{H}_2\text{O}$
- e. aluminum nitrate nonahydrate $\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$
